

HANNIBAL LECTER

has **nothing** on the

“COLORADO CANNIBAL”

How do we know?

Dear Friend:

In the brutal winter of 1874, Alferd Packer crossed Colorado's San Juan Mountains with a party of five other men. Fifty-seven days later, after being snowbound and presumed dead, Packer emerged – alone, healthy, and well-fed.

The "Colorado Cannibal" has been popular Western history for over a century – but it wasn't until the bones of Packer's victims were re-examined by archaeologists in 1989 that the conclusion was drawn that Packer had not only eaten his comrades...he had killed them.

ONLY AN ARCHAEOLOGIST KNOWS WHAT:

- Stalagmites tell us about climate change in the prehistoric Southwest.
- Utensils taken from a 500-year-old garbage dump reveal about the painter Hieronymous Bosch.
- Animal bones illustrate about a baby boom that happened 40,000 years ago.
- Mollusk-shells in Peru tell us about El Nino's effects on the California coastline.

WHAT WILL ARCHAEOLOGY REVEAL TO YOU?

There's only one way to find out. Accept the **FREE ISSUE** we've reserved in your name. Send no money. Assume no risk.

Warmly,

Peter Young
Editor In Chief

P.S. The return envelope for your Order Card is postpaid. How's that for service?
